MOLD MAKING CLASSES

These classes are not for people who make molds or body castings; they are for people who want to know how to make molds and body castings. The TCS courses are geared toward new-comers who want to know about the materials available and the basics of how to use them. They are designed for the beginner.

An important step in successful mold making is being familiar with mold making materials available to you. The more you know about the materials and their characteristics, more likely the better your mold will be. Another important step is knowing the various types of molds that can be made and when to use them.

These classes are devoted to discussion demystifying various mold making materials such as polyurethane, polysulfide, silicone, alginate and wax, each has their own properties, inhibitions & characteristics; as well as advantages and disadvantages. Other topics that will be covered include mold types; for example: what is a box mold, a multi-part mold, what is and why a mother mold is needed and mold storage.
